

Rudy's Retro Intelligence

NABU Personal Computer Diagnostics and Repair Manual

Version 1.7.6 Created in April 2023

Created by Rudy's Retro Intel @2023

<https://www.youtube.com/@RudysRetroIntel>

The purpose of this manual is help diagnose and repair the NABU PC (personal computer) and is based on the motherboard revision 01 and stock ROM. As other versions appear, if any, they will be eventually added to this document. Future versions will be available as more information is collected, tested and verified.

***** This document is based on the work I have performed on my NABU computer and is provided "as is". I\we do not take any responsibility for errors and\or damages that may occur when repairing your NABU computer. This is information is provided freely to all NABU computer owners. Please ensure you know how to perform electronics\electrical work. If not, please contact someone who has these skills before starting. *****

Additional support was provided by:

- Geek With Social Skills (<https://www.youtube.com/@geekwithsocialskills>)
- The technical manual and schematics for the NABU PC were done by MJP while reverse engineering the NABU PC. MJP are his initials and on the original PDF (NABU_Computer_Technical_Manual_by_MJP.pdf)
- NABU Personal Computer User's Manual
- Data sheets found at <https://www.datasheets.com> , <https://datasheetspdf.com/> and https://archive.org/details/ic_datasheets?and%5B%5D=subject%3A%22office+box%22&sort=date
- IC pinouts, visit <https://www.futurlec.com/IntegratedCircuits.shtml>
- Joe's Computer Museum (<https://www.youtube.com/@JoesComputerMuseum>)
- French translation by 1Bit Fever Dreams <https://www.youtube.com/@1BitFeverDreams>

For the latest version of this document and other NABU related information, use the links below.

<https://www.nabunetwork.com>
<https://github.com/RudyRetroIntel/Vintage-Computer-Diagnostics>

"Thank you to everyone who helped with this documentation. With this knowledge we can ensure that the NABU personal computer can be repaired and enjoyed now and into the future.

Rudy's Retro Intel"

Shown below is where you can find the motherboard revision 01.

**Check your board revision as these diagnostics may differ.*

The NABU Computer Configuration

- Processor (CPU) is a Zilog Z80A microprocessor running at 3.58Mhz
- Total of 80K of memory and is configured to use 64K for the Z80A processor and dedicated 16K for video memory
- Frequency comes from a 10.735635Mhz crystal which is divided down to 3.579545 (3.58) Mhz
- Four slots are available to add additional cards
- ROM is a 4K byte which contains the bootstrap software. Other boards have an 8K ROM
- Outputs to composite or a NTSC frequency via the RF modulator. Text mode = 24, 40-character rows in 2 colors. Graphic mode = 32 x 24. Total screen resolution is 256 x 192 pixels, 15 colors plus transparent capabilities, sprite-oriented, hardware-supported animation
- Keyboard uses an unregulated +10VDC to power the unit and receives\sends via an EIA RS422 over twisted pair cable with shield at 6992 BAUD rate
- Printer port uses a DB-15 (female D-Type) Centronics parallel printer standard connection with handshake
- Audio output is 10K ohm output impedance, 1.5V p-p signal for driving separate audio amplifier or input to a monitor
- Adapter port provides a full duplex, 111 Kbit per second serial interface

** Any software troubleshooting is beyond the scope of this document. Here we will only cover hardware related issues. **

Location of ICs

The image below shows the location of all major ICs. Use this as a reference.

Video IC: TMS9918ANL – Video Display Controller by Texas Instruments

Keyboard IC: D8251AC – Programmable Communication Interface by Rochester

Serial\Network IC: TR1863-B-02 – Universal Asynchronous Receiver/Transmitter by Western Digital

CPU IC: Z80A – Microprocessor by Zilog

Sound IC: AY-3-8910 – Programmer Sound Generator by ETC

ROM: 2732G EPROM

Video Memory ICs: TMS 4116-15NL by Texas Instruments

System Memory IC: HM4864P-2- 65536 x 1 Bit DRAM by Hitachi

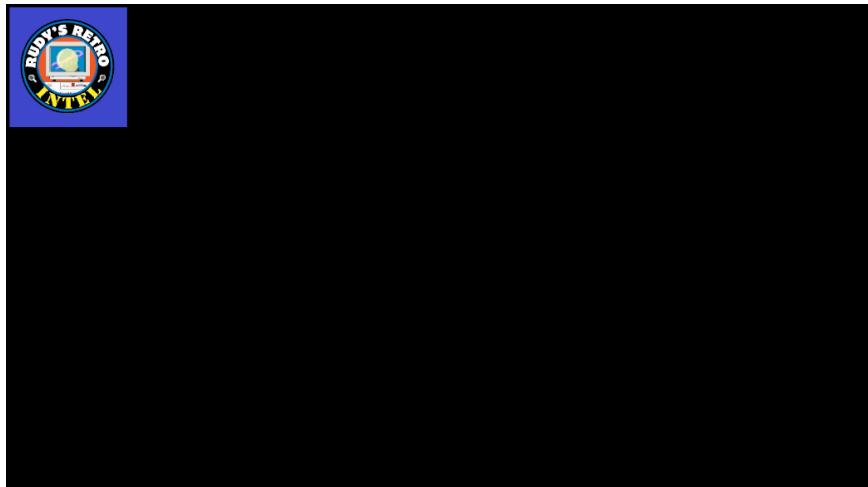

* When placing the lid on the NABU personal computer, ensure that the side with the holes is on the side closest to the motherboard. If you place the lid on the opposite way, the system can\will over heat. These holes allow for cooler air to pass over the motherboard and into the power supply. From there, the hot air is expelled out the back of the power supply via the built in fan *

Pictorial Diagnostics

With your NABU personal computer turned on, view the following images and find the one that closely matches what you are viewing on your screen. Next look at the corresponding diagnostic information.

- Where possible, links to vendors where parts can be purchased will be shown. No affiliation with any vendors. Check your favorite vendor for replacement parts
- IC pinouts are included where available. See “*IC Pinouts*” in the index
- **NOTE: Your background color may be different. My background is blue however the video capture device changed it. This doesn't matter as the images will be the same.**

Complete System Failure

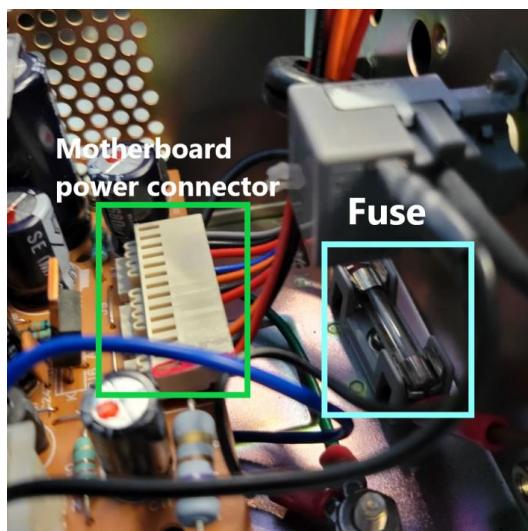

Symptom: Black screen, no sound. The Alert LED located on the front panel may be ON.

Diagnoses: This is a major fault and the following needs to be tested\replaced.

Test\Replace Power supply

- Check power plug is connected and power is available from wall socket
- Check fuse located inside power supply. See image below
- Ensure motherboard connection to the power supply is connected and secure. See image below
- Press down all ICs in sockets, as they can have poor contact(s) due to heat
- Ensure that the lid side with the holes is on the side closest to the motherboard
- Other possible issues could be related the power supply electronics. Future versions of this documentation may cover power supply repairs
- Inside power supply. Note the motherboard connector and fuse locations.

Test\Replace video cables and\or monitor\TV used.
Test\Replace ROM – **U53** - 2732G EPROM: Burn new EPROM and replace
Test\Replace Video processor – **U2** - TMS9919ANL. See pinout diagram on next page
Test\Replace CPU – **U54** - Zilog Z80 processor. See pinout diagram on next page
Test\Replace Transistors 2N3904

Network Adapter Failures

Symptom: Failure to connect to the NABU network.

Diagnoses: This is normal if you do not have a connection to the NABU server\network. If connecting to the network and are getting this error, check connections and network status.

Check that the adapter cable is connected and verify that the pin connections are correct. See the diagram at the end of this document.

If errors are still present test\replace **U14** - TR1863P-02, **U29** - 74LS32, **U12** UA9637ACP and\or **U13** - UA9638ACP, **U32** - 74LS00

Keyboard Failures

Symptom: Keyboard not working.

Diagnoses: Check that the keyboard is connected to the NABU computer.

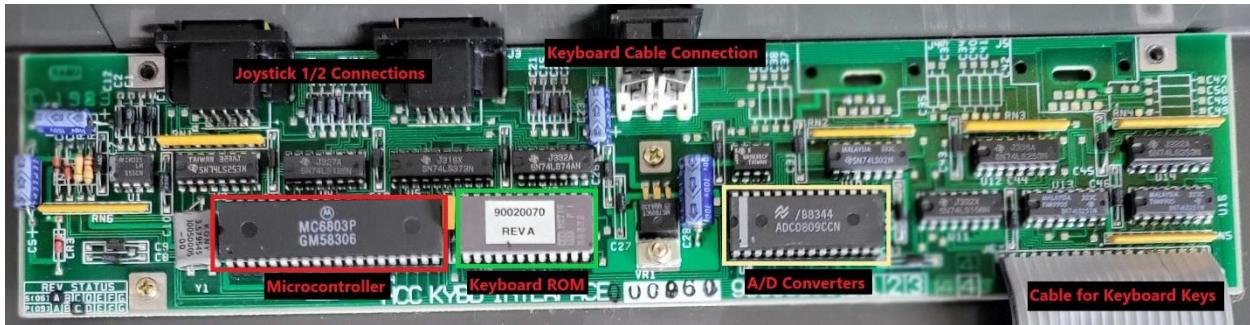

Symptom: Keyboard connected properly however; Alert LED is ON.

Diagnoses: Replace **U4** - D8251AC, **U8** - 74LS32 *within the NABU PC.*

Keyboard Internals

Logic board inside the keyboard itself.

With continued keyboard issues, the following should be tested\replace as needed.

Diagnoses:

MC7805T - 7805 5V 1A Positive Regulator – Ensure proper voltage is present

Ribbon Cable – Cable to connect logic board to physical keys – Check for damage and verify continuity

MC6803P - 8-Bit A/D Converter with 8-Channel Multiplexer – Use datasheet and oscilloscope

ADC0809CCN - Converters with 8-ChannelMultiplexer – Use datasheet and oscilloscope

ROM – Custom NABU PC keyboard ROM – Use datasheet and oscilloscope

555 – Timer IC – Use datasheet and oscilloscope

All support ICs – Review each IC's logic with datasheet and oscilloscope

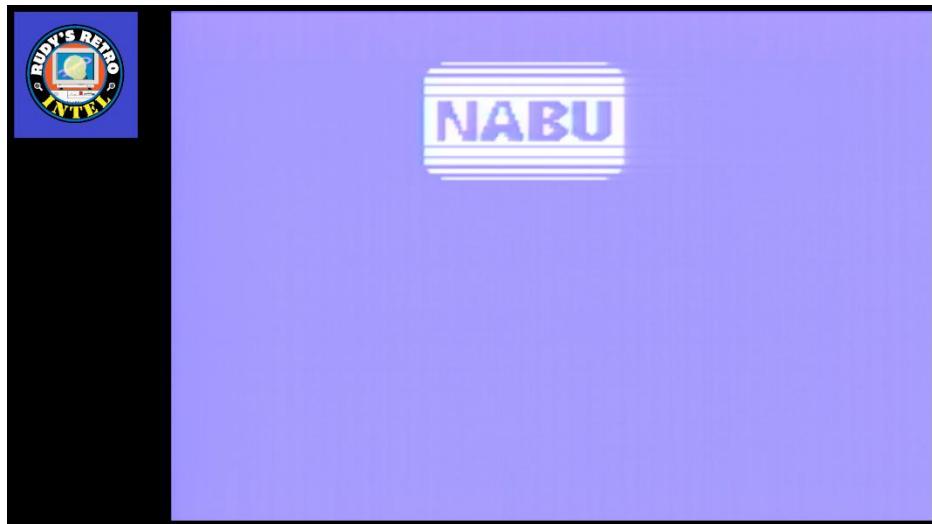

Sound Failure

Symptom: Sound Failure message, no sound heard, Alert LED on.

Diagnoses: Replace **U25** - AY-3-8910 sound generation IC. **U15** - LM3900, **U35** - 74LS373, **U54** - Z80 processor, **U26** - 74LS153, **U27** - 74LS32, **U39** - 74LS00, **U36** - 74LS74, **U28** - 74LS38, **U34** - 74LS348, **U32** and **U33** - 74LS00, **U1** - 74LS14

Serial Failure

Symptom: NABU logo and no other characters.

Diagnoses: Replace **U14** - TR1863-B-02 – Universal Asynchronous Receiver/Transmitter

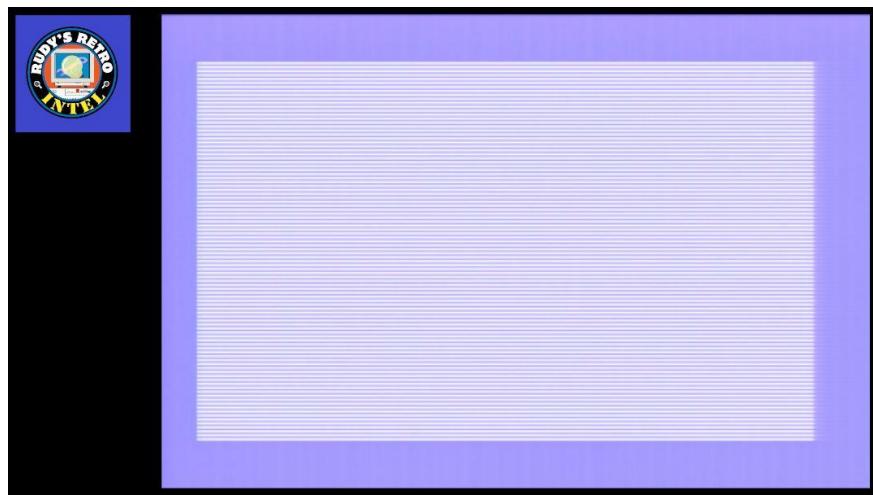

LED Display Failures

Symptom: NABU computer LEDs not displaying or have some not working

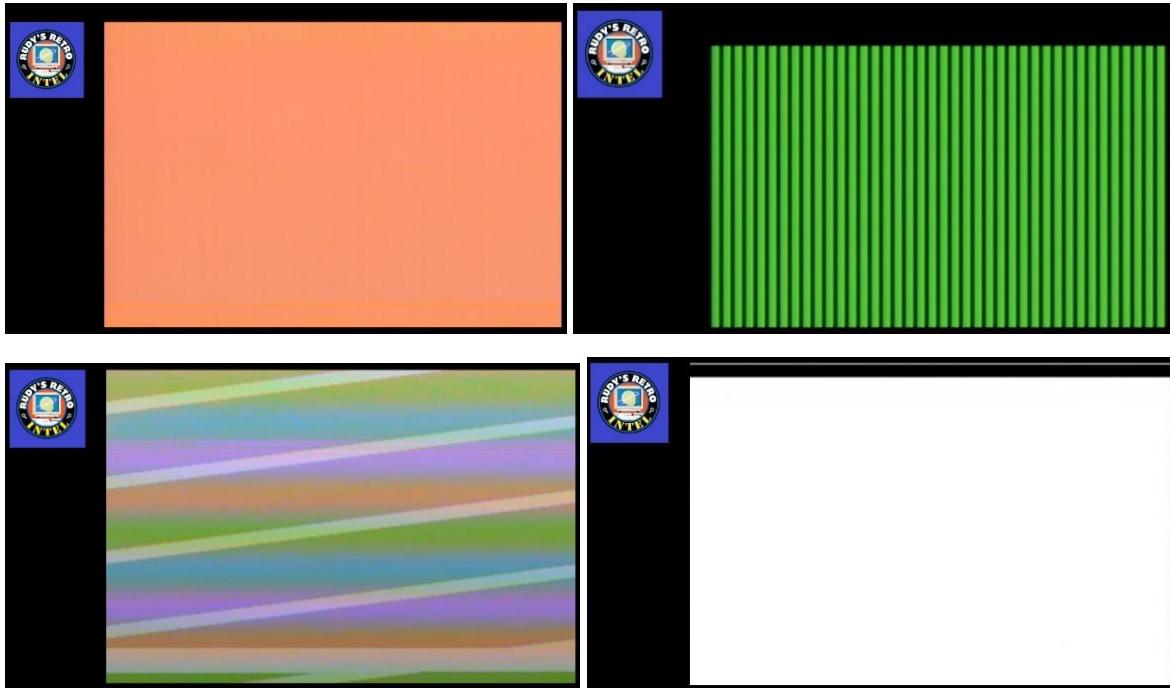

Diagnoses: Replace **U5** - SN7406, **U6** - 74LS273, replace LED(s), Check +5VDC, **U8** and **U27** - 74LS32

System RAM Failures

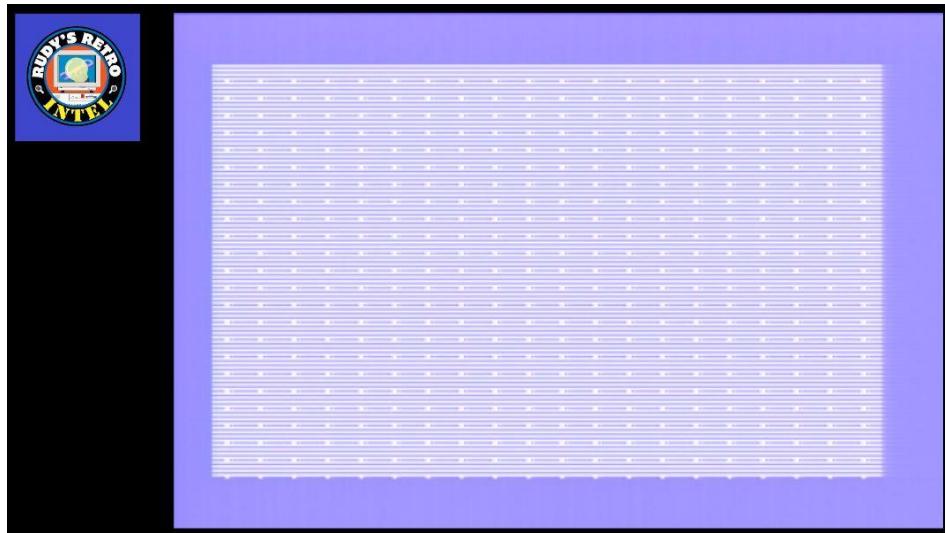

Symptom: No text, small\fine vertical bars.

Diagnoses: Replace **U42, U43, U45, and\or U49** - HM4864P DRAM, **U51 and U52** – 74LS157, **U54** -Z80 CPU, **U37, U9, U57** – 74LS32, **U39** – 74LS00, **U56** – 74LS04, **U36** – LP76-57, **U55** – 74LS260, **U28** – 74LS38

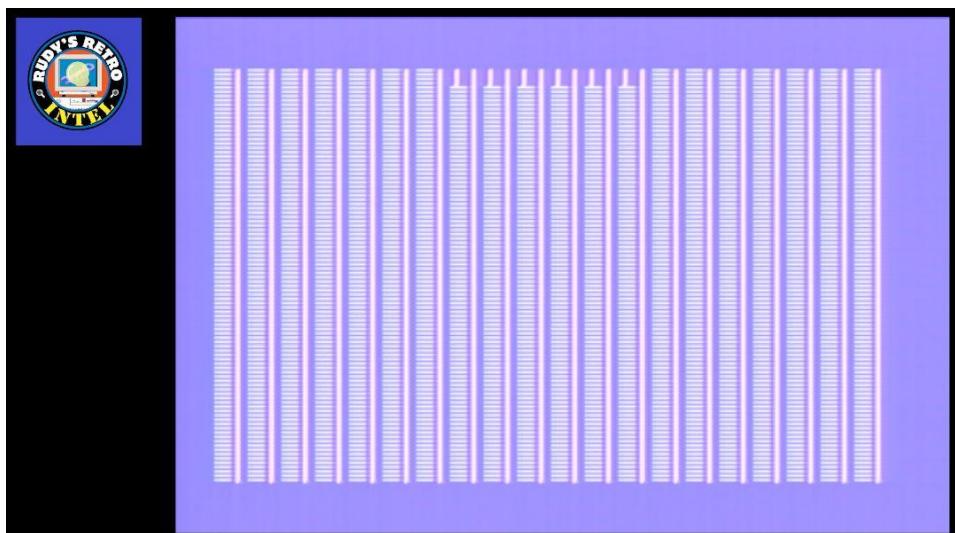

Symptom: Solid color, vertical green bars, scrambled colors and\or white screen.

Diagnoses: Replace **U44** with HM4864P – DRAM Chip DRAM 64Kbit 64Kx1 5V.

Symptom: Fine stripes with dots aligned vertically and horizontally.

Diagnoses: Replace **U46** - HM4864P – DRAM Chip DRAM 64Kbit 64Kx1 5V.

Symptom: Vertical bars (solid and non-solid bars), NABU logo tries to display.

Diagnoses: Replace **U47** - HM4864P – DRAM Chip DRAM 64Kbit 64Kx1 5V.

Symptom: NABU logo tries to display, Error: “RE-TYPE CHANNEL CODE” appears. This screen may disappear and reappear, flashing message.

Diagnoses: Replace **U48** - HM4864P – DRAM Chip DRAM 64Kbit 64Kx1 5V.

Video RAM Failures

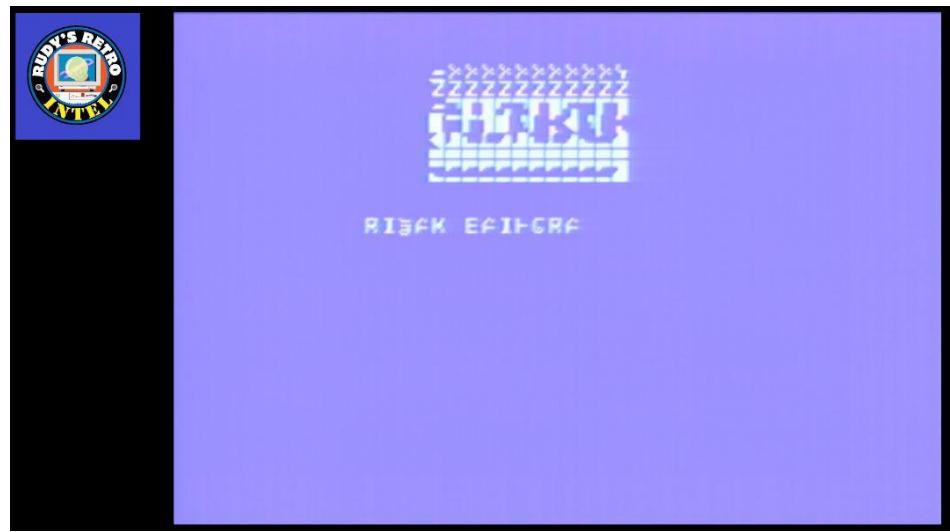

Symptom: NABU logo and text characters not shown correctly.

Diagnoses: Replace **U17** - TMS4116-15NL – DRAM, **U3** – 74LS32, **U1** – 74LS74, **U59** – 74F04, **U56** – 74LS04, **U7** – 74LS74, **U31** – 74LS14

Symptom: NABU logo and text characters not shown correctly.

Diagnoses: Replace **U18** - TMS4116-15NL - DRAM 16,384-Bit (16Kx1) 150ns 5V.

Symptom: NABU logo and text characters not shown correctly.

Diagnoses: Replace **U19** - TMS4116-15NL - DRAM 16,384-Bit (16Kx1) 150ns 5V.

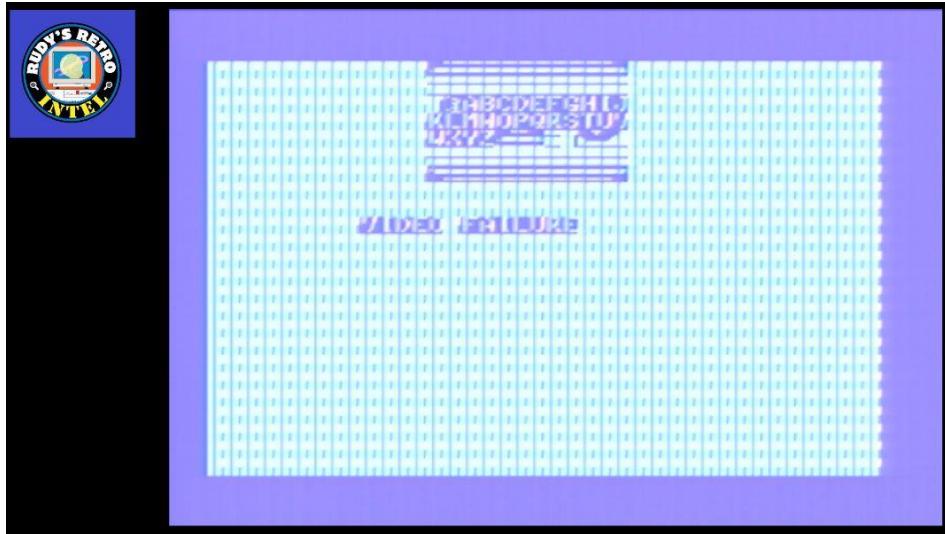

Symptom: NABU logo and text characters not shown correctly.

Diagnoses: Replace **U20** - TMS4116-15NL - DRAM 16,384-Bit (16Kx1) 150ns 5V.

Symptom: NABU logo and text characters not shown correctly.

Diagnoses: Replace **U21** - TMS4116-15NL - DRAM 16,384-Bit (16Kx1) 150ns 5V.

Symptom: NABU logo and text characters not shown correctly, inverse vertical bars displayed.

Diagnoses: Replace **U22** - TMS4116-15NL - DRAM 16,384-Bit (16Kx1) 150ns 5V.

Symptom: NABU logo and text characters not shown correctly and\or blurred.

Diagnoses: Replace **U23** - TMS4116-15NL - DRAM 16,384-Bit (16Kx1) 150ns 5V.

Symptom: NABU logo and text characters not shown correctly, displays video failure message correctly.

Diagnoses: Replace **U24** - TMS4116-15NL - DRAM 16,384-Bit (16Kx1) 150ns 5V.

Card Slot Failure

Symptom: Optional cards not working properly, not working, not recognized in slot J9-J12.

Diagnoses: Replace **U30, U40** and\or **U41** - 74LS241. **U9, U29** and\or **U37** - 74LS32. Check optional card and perform additional troubleshooting.

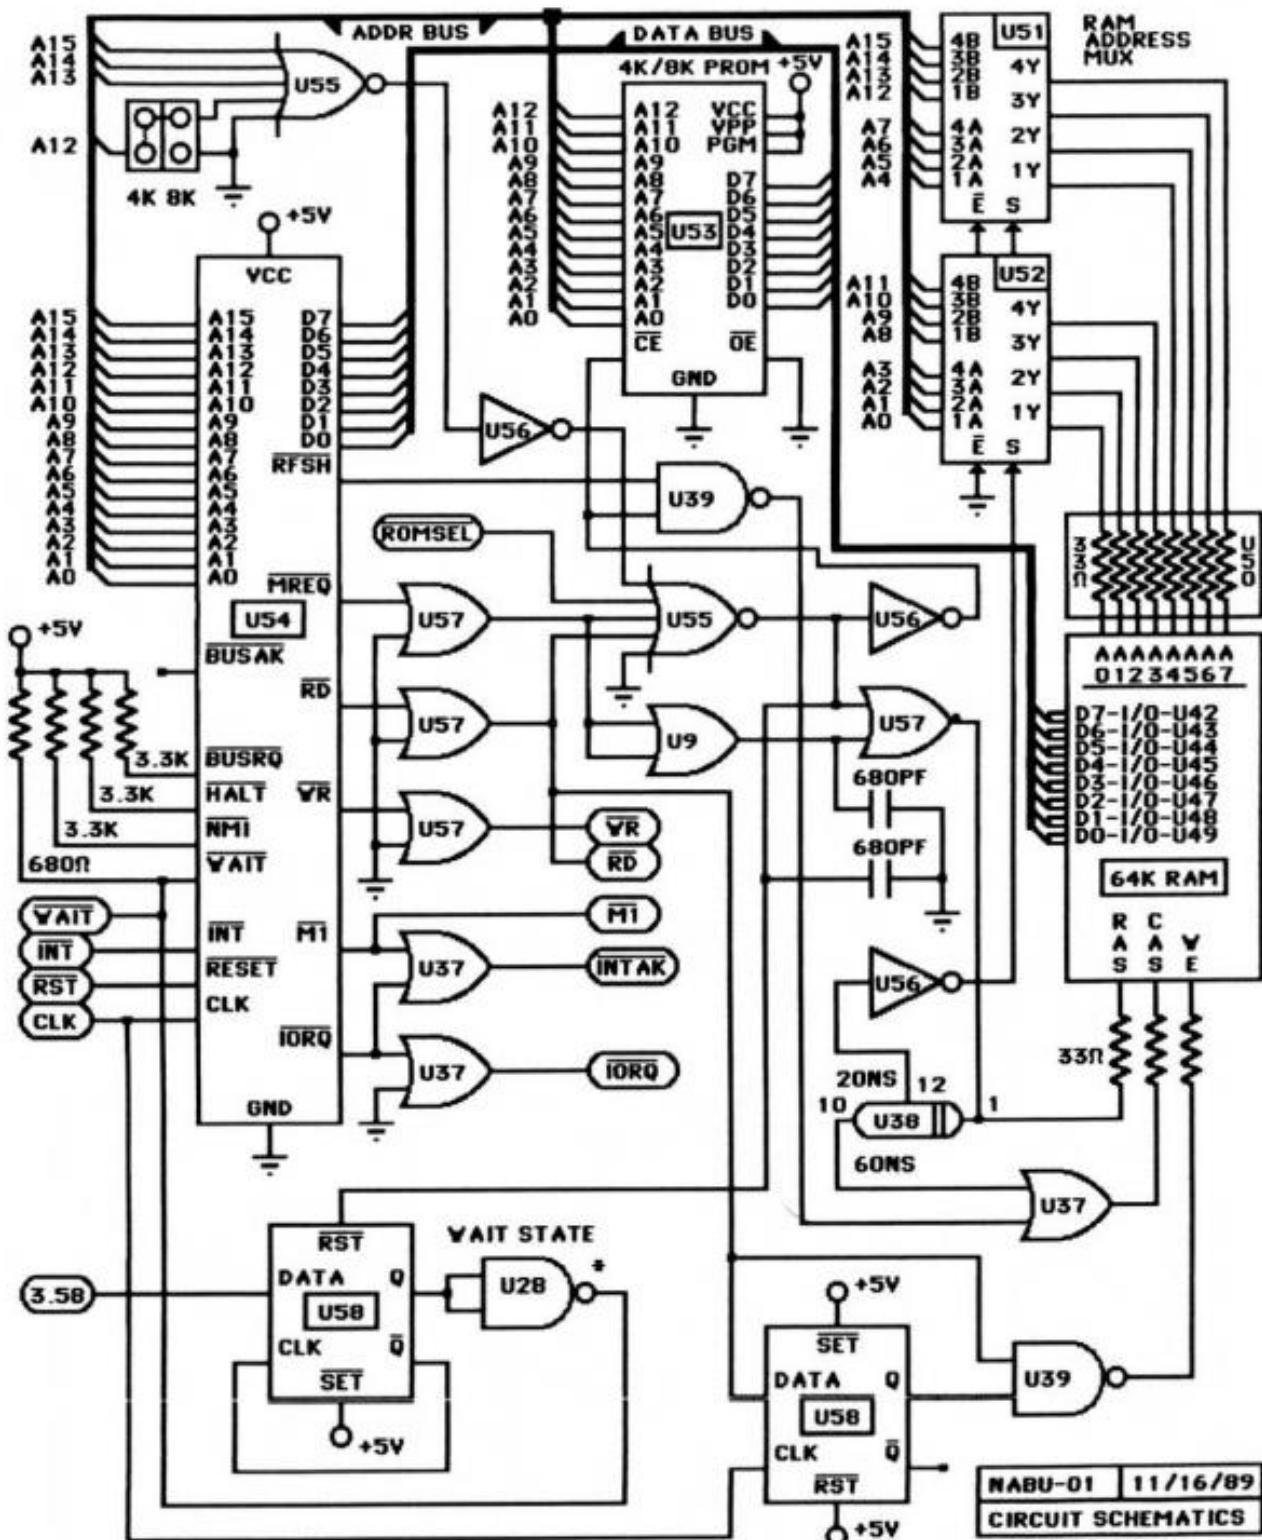

Parallel Port Failure

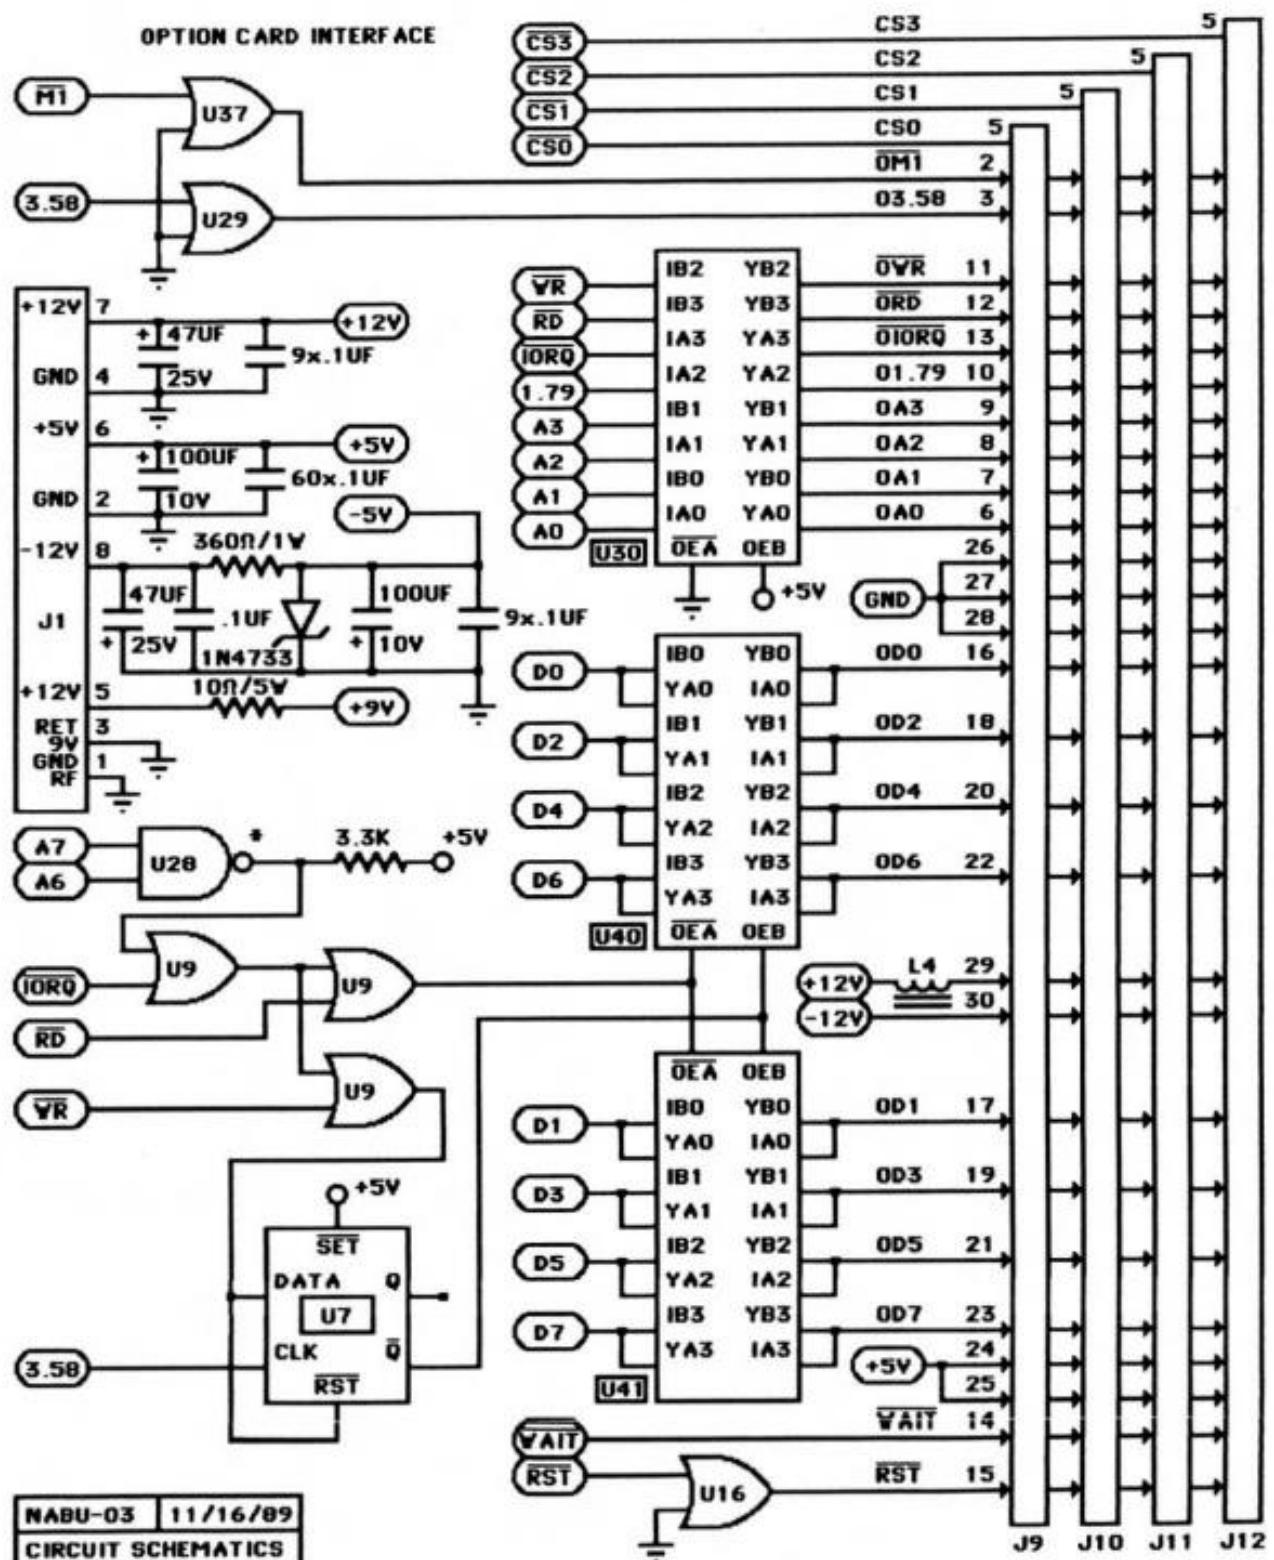

Symptom: Parallel port or device not working properly, not working, not recognized.

Diagnoses: Replace **U11**, **U6** - 74LS273, **U8**, **U27** – 74LS32, **U12** - UA9637ACP.

NABU Connector Pinouts

Listed below are the pin outs and description for the connectors on the NABU computer.

LED display connection is an 8-pin header

Pin 1 = Power On indicator and is GREEN

Pin 2 = Pause indicator and is YELLOW

Pin 3 = Alert indicator and is RED

Pin 4 = Check indicator and is GREEN

Pin 5 = Reset Switch

Pin 6 = Ground\logical ground

Adapter connection is a 5 pin DIN connector and uses the following configurations

Pin 1 = Receive + (positive)

Pin 2 = **Not used**

Pin 3 = Transmit – (negative)

Pin 4 = Receive – (negative)

Pin 5 = Transmit + (positive)

Power supply unit

Power supply which is an ASTEC (AC8152) or a TDK (MRM146U) which outputs 40 WATTS

Voltage Output DC

Pin 1 = -12VDC (negative) with a maximum current of 0.5 Amps

Pin 2 = +12VDC (positive) with a maximum current of 2.5 Amps

Pin 3 = Common connection

Pin 4 = +5VDC (positive) with a maximum current of 5 Amps

Game controller connection

Pin 1 = Contact for UP movement

Pin 2 = Contact for DOWN movement

Pin 3 = Contact for LEFT movement

Pin 4 = Contact for RIGHT movement

Pin 5 = **Not used**

Pin 6 = Contact for FIRE control

Pin 7 = **Not used**

Pin 8 = Ground

Pin 9 = **Not used**

Keyboard connection is a 6 pin DIN

The keyboard uses a MC6801 micro processor

Pin 1 = Not used – use as shield ground

Pin 2 = +9VDC

Pin 3 = +9VDC

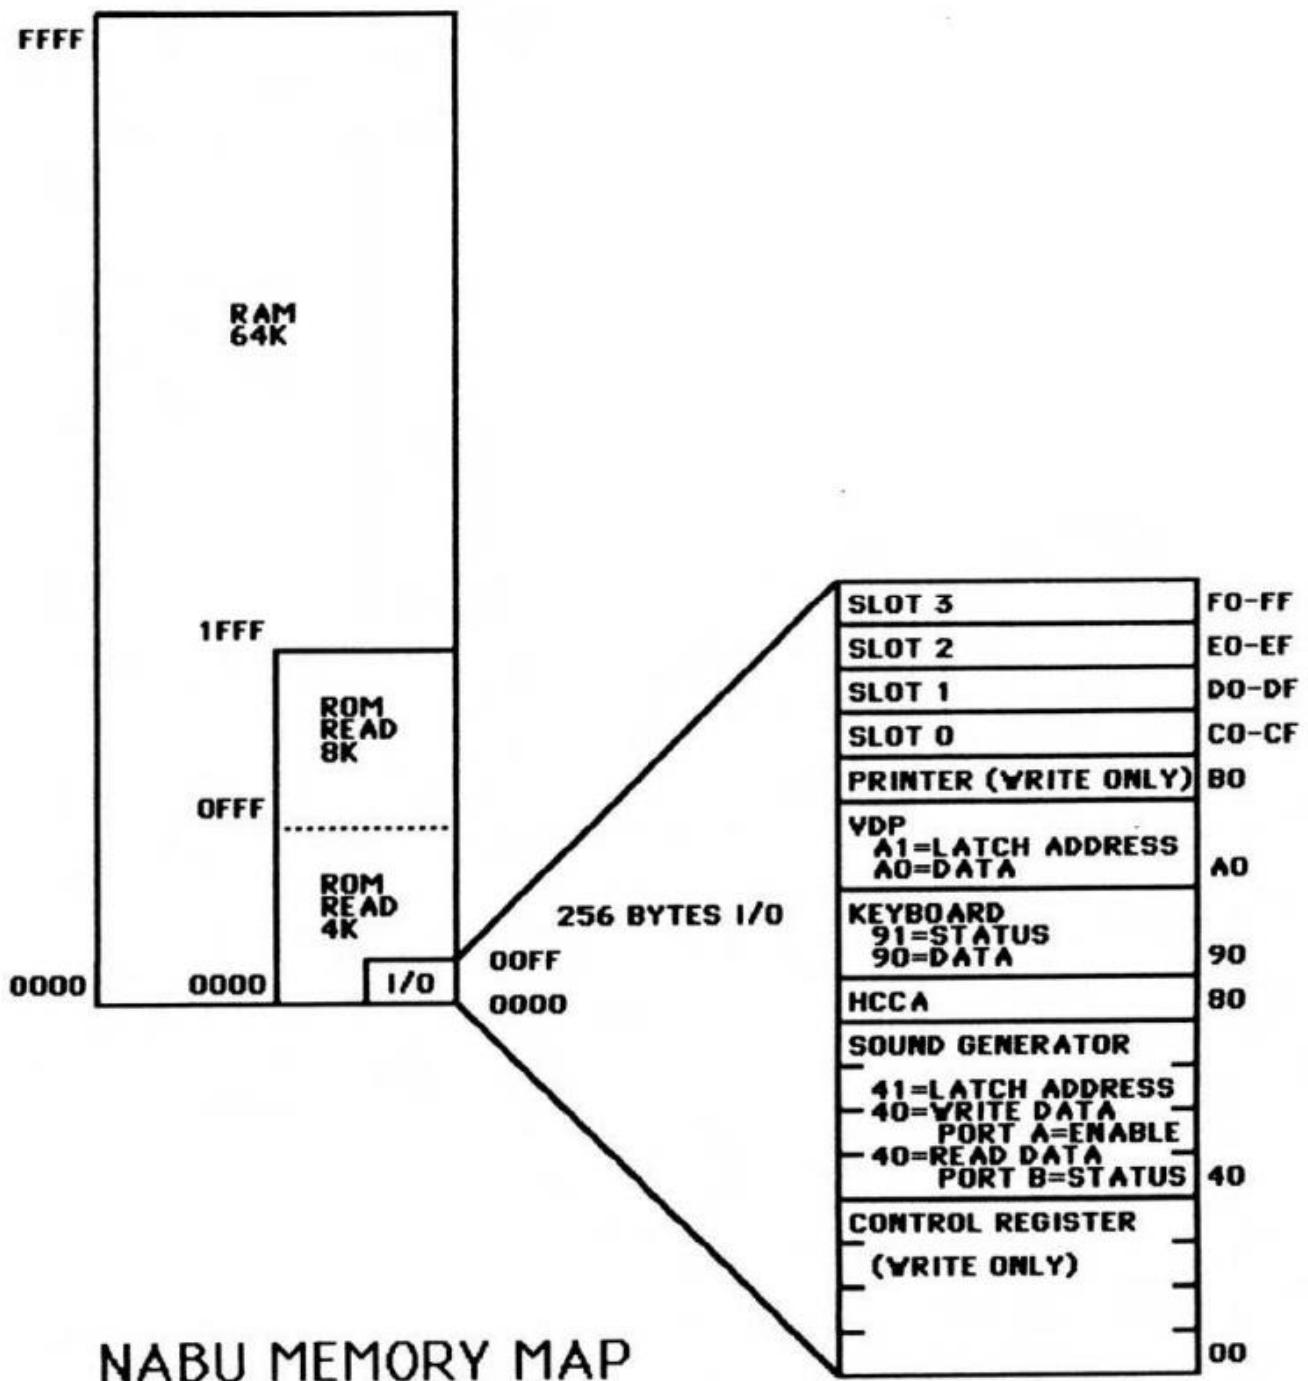

Pin 4 = Transmit +(positive)

Pin 5 = Transmit – (negative)

Pin 6 = Not used

Bodge Wires Connection

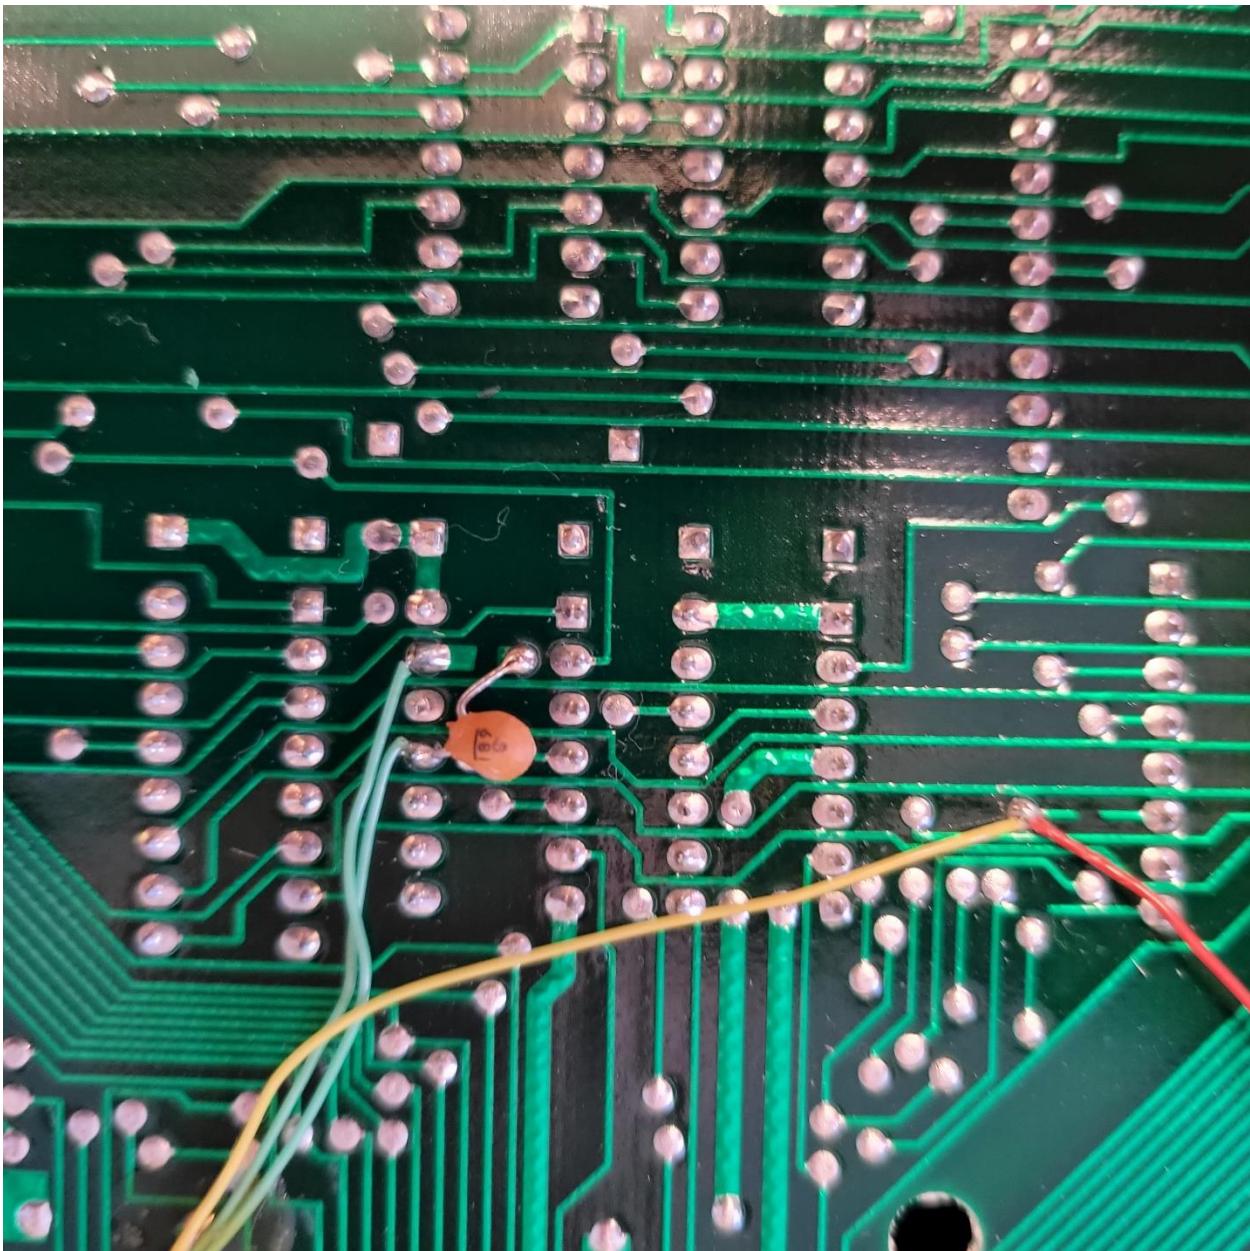

On the back of the motherboard there are several bodge wire connections. Below are the images that show these connections. If some are missing or you need to remove them to perform repairs, these images could be used to help with the reattachments. Take pictures before removing wires.

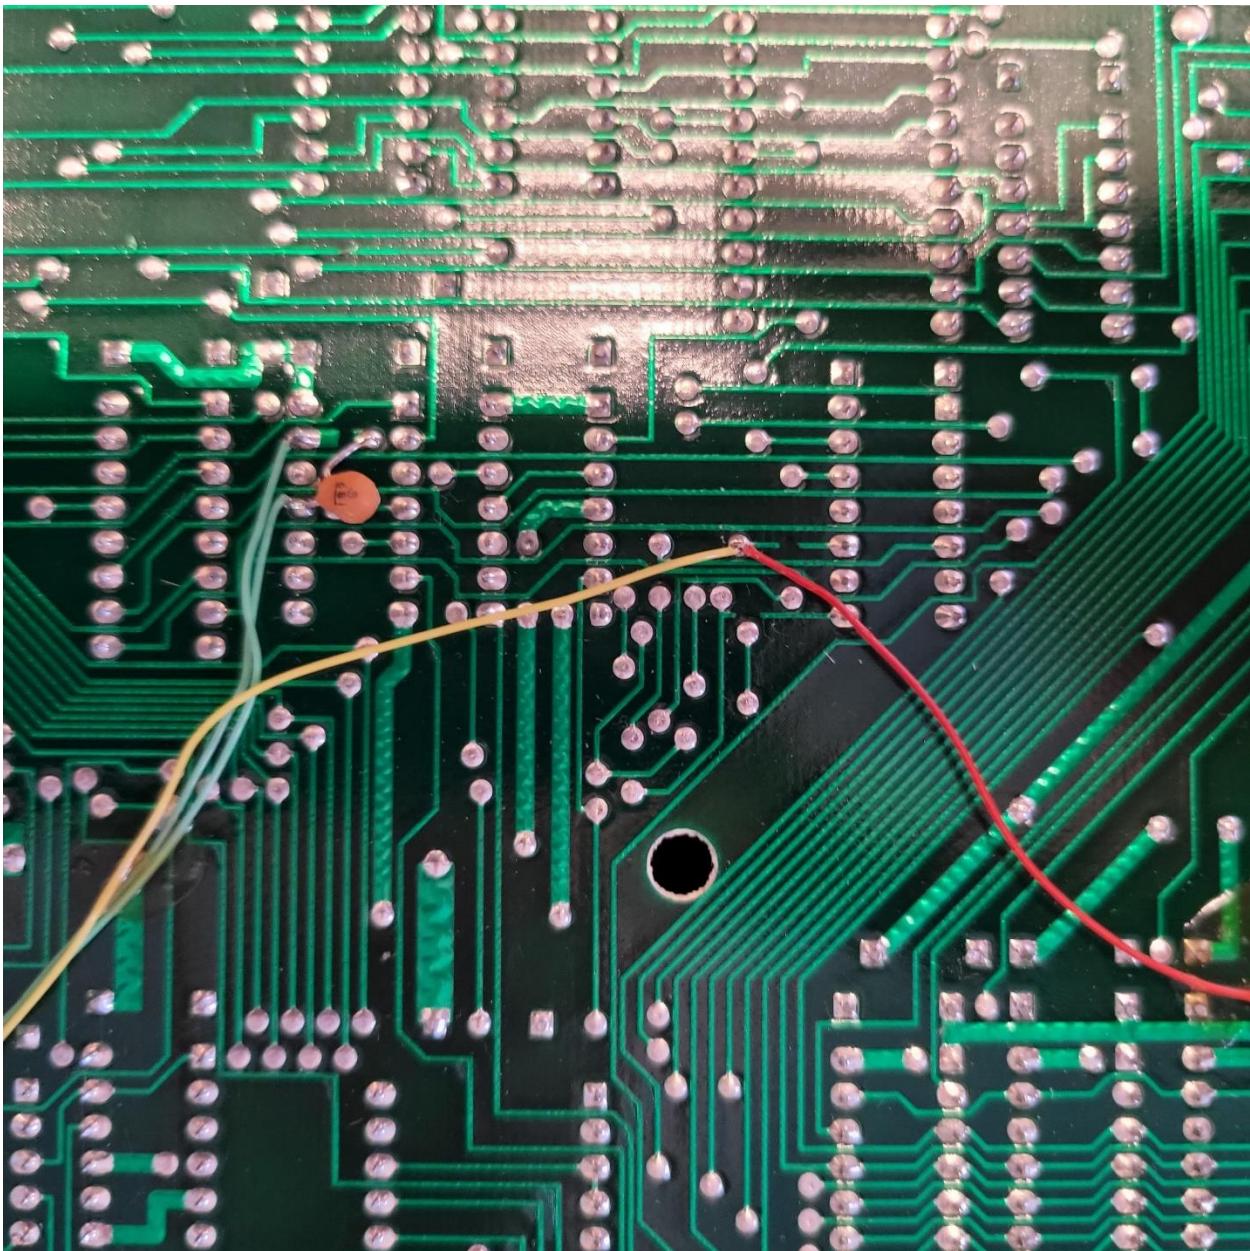

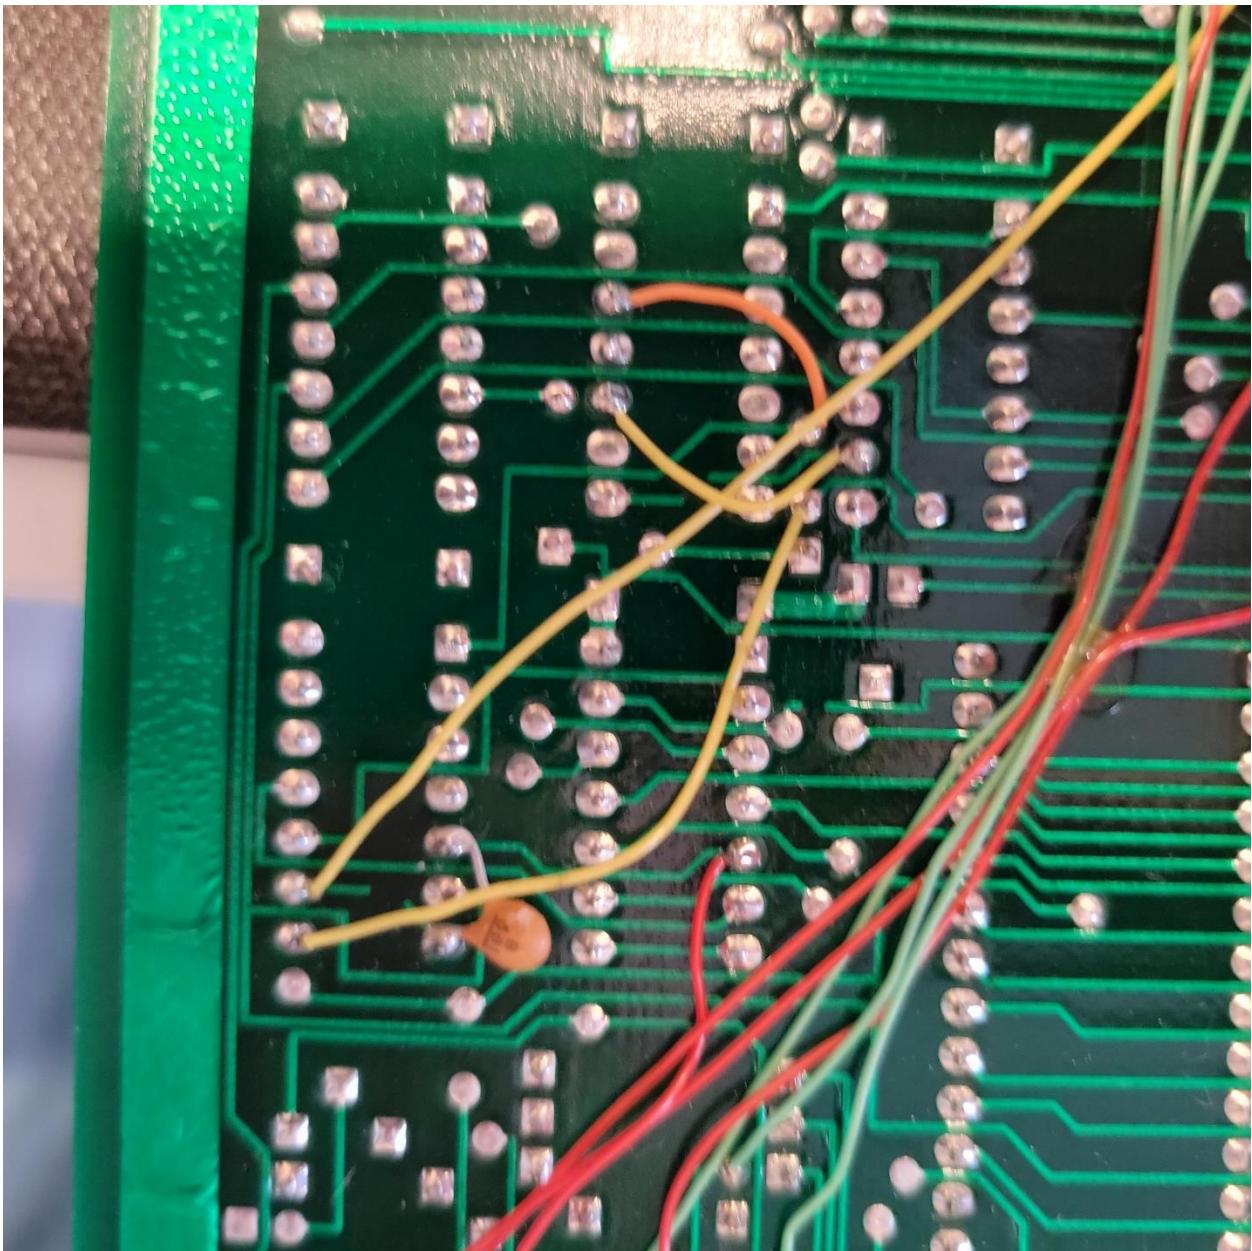

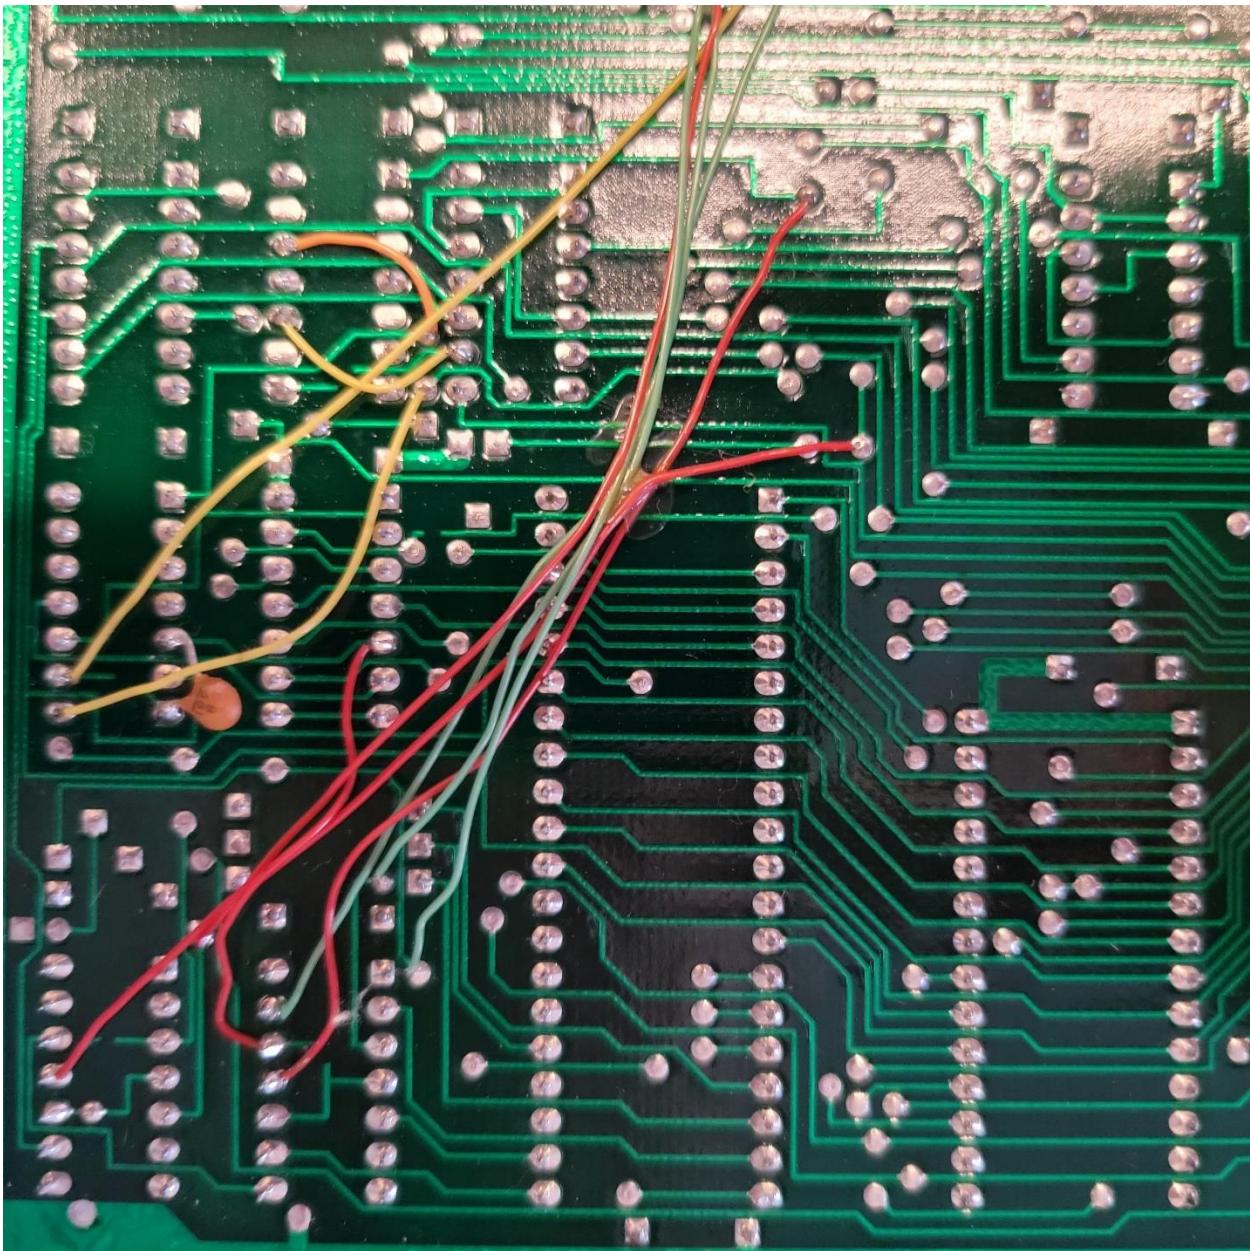

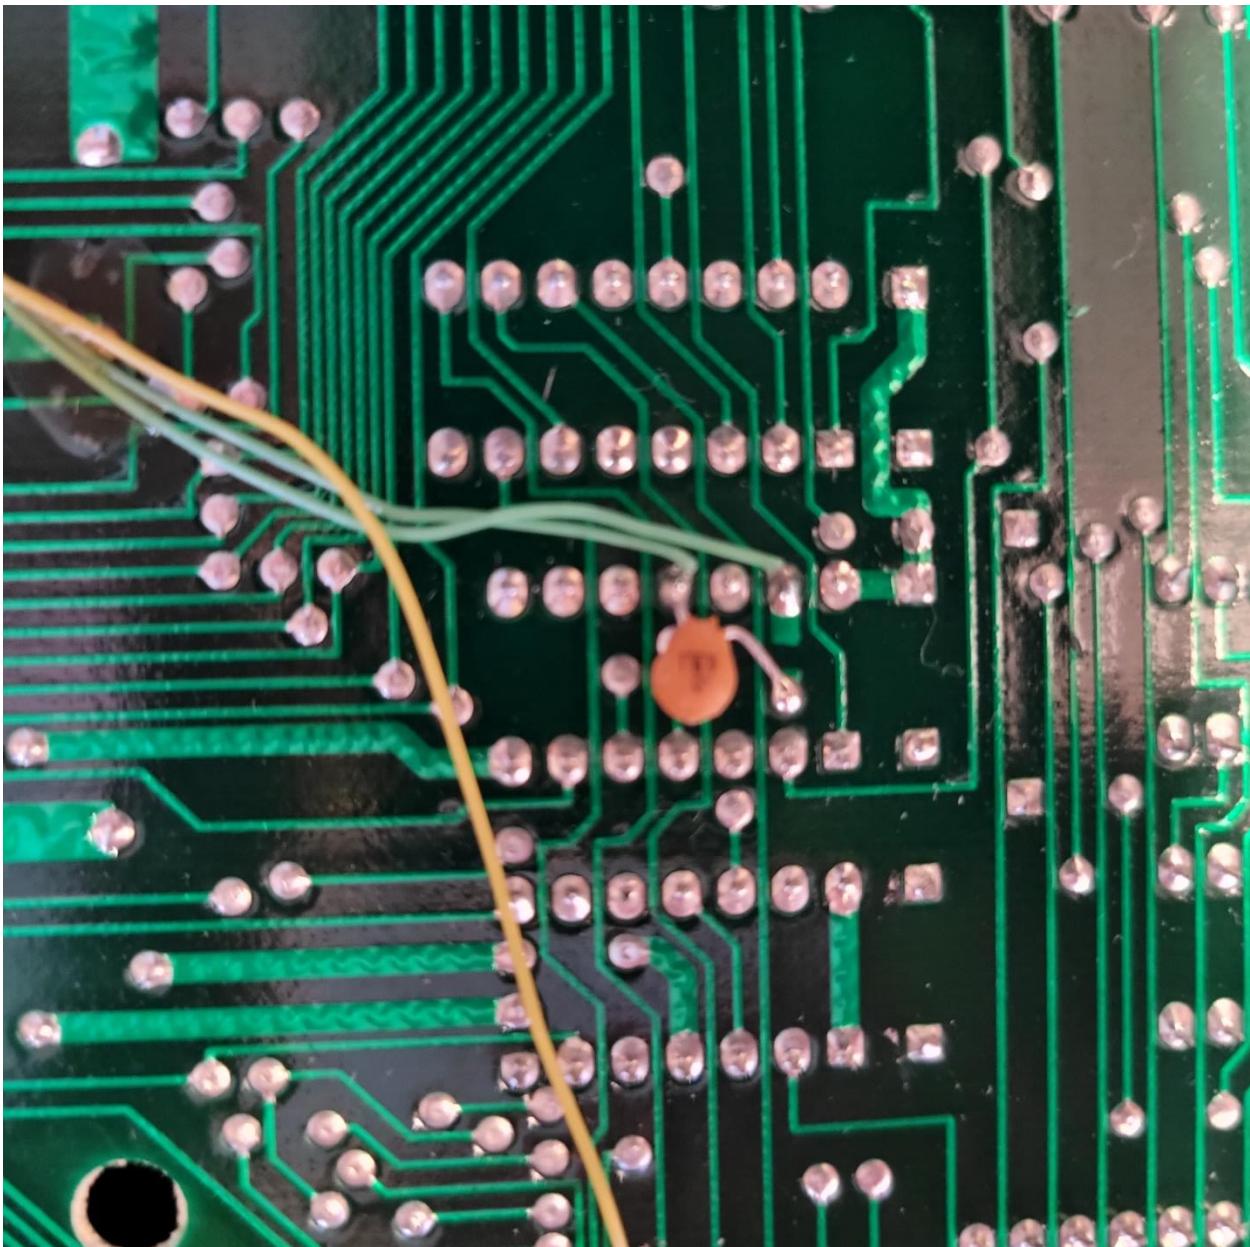

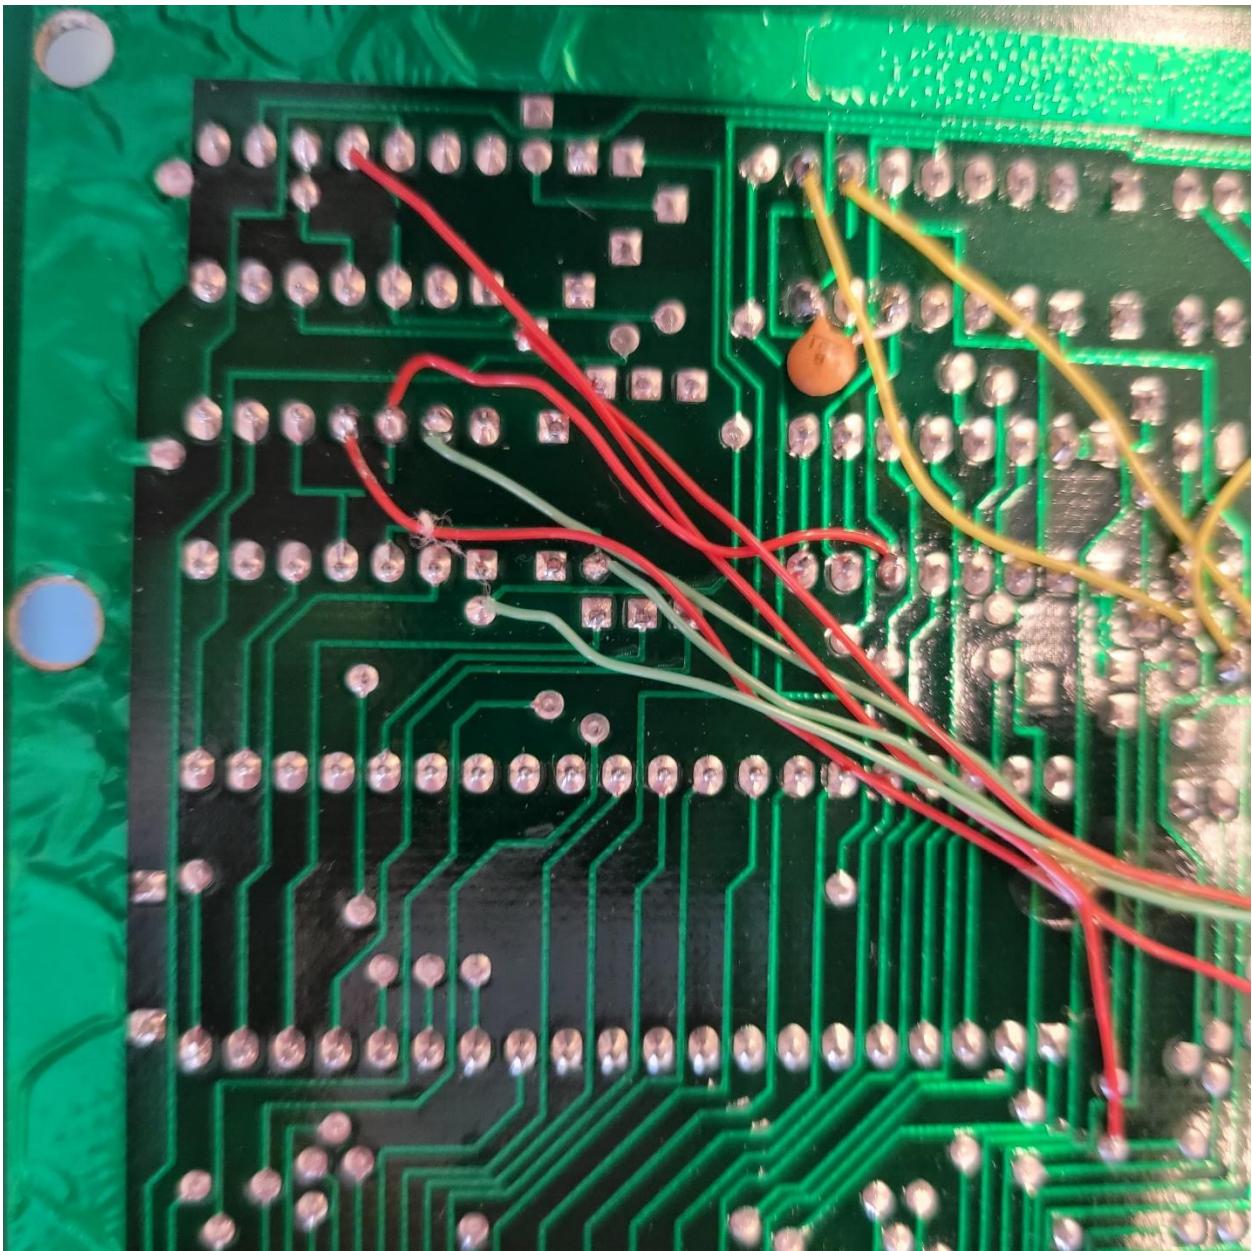

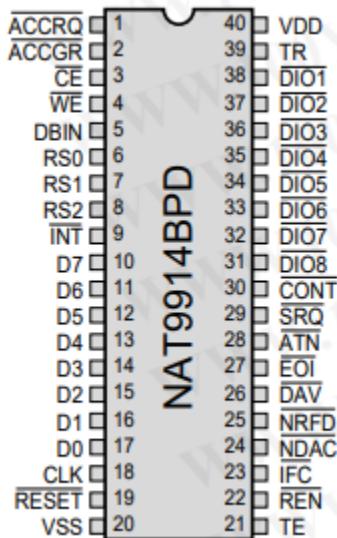

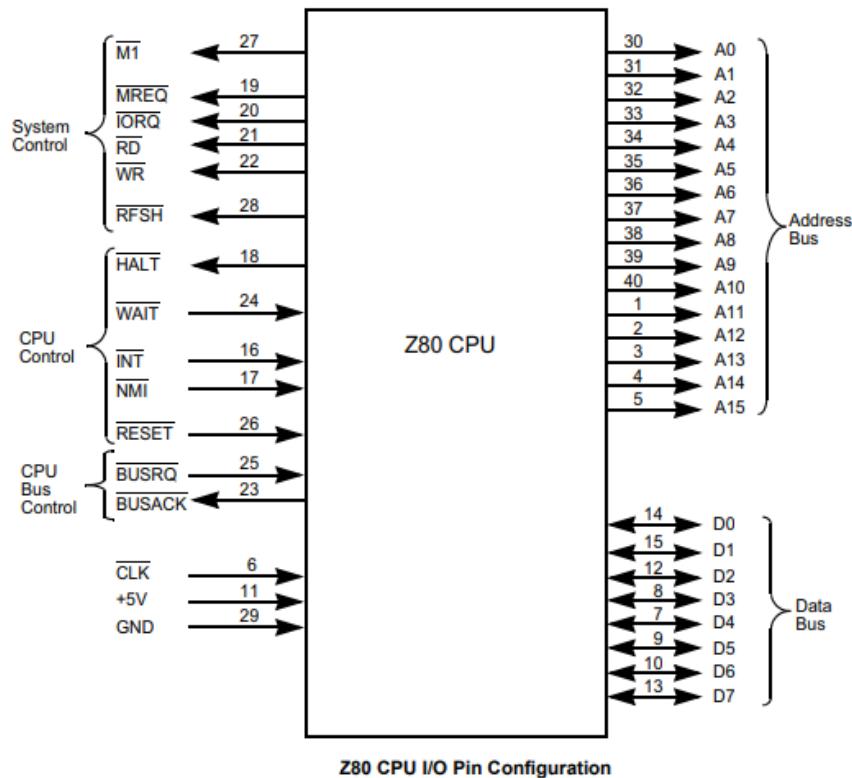

IC Pinouts

Video processor – TMS9919ANL pinout. TMS9919ANL is pin compatible with NAT9914BPD

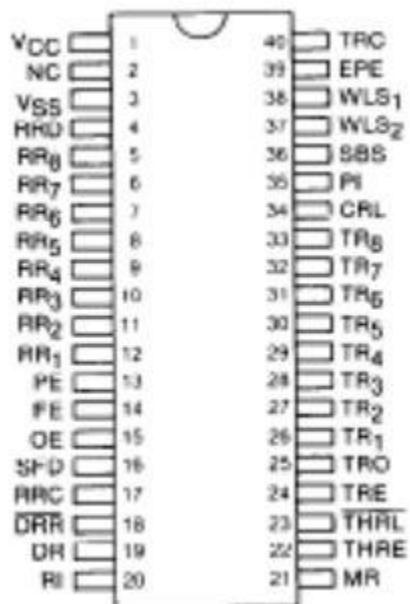

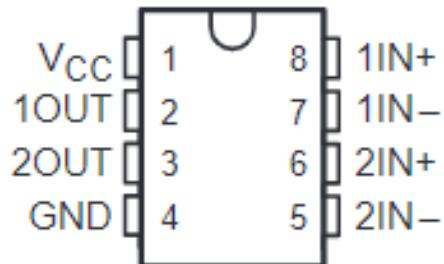

Z80 Processor pinout.
